

STAY EFFICIENT

ABOUT THE APP

Invariant is an open source protocol built on the Solana blockchain allowing users to bond, farm and swap tokens based on liquidity pools. Our main goal is to change the AMM DEX stage on Solana. We are going to achieve it thanks to full permissionless, capital efficiency and protocol owned liquidity.

Invariant is a one of a kind platform that stands out among many ordinary exchanges

LOW FEES + CAPITAL EFFICIENCY → **BROAD ACTIVE LIQUIDITY** → **LOW PRICE IMPACT AND BETTER PRICE**

PERMISSIONED

Parameters	Invariant	RAYDIUM	ORCA	Saber
Stable assets	0.01%	0.25%	0.07%	0.04%
Unstable assets	0.05%	0.25%	0.30%	-
Permissionless	Fully	Limited	No	No
Concentrated liquidity	Yes	No	Yes	No
Open source	Yes (after security audit)	No	No	Yes

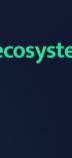

\$INVNT TOKEN

aims to provide many benefits and increase its value along with the growth of the platform.

1. Governance

INVNT tokens will allow holders to participate in governance through creating proposals and voting on existing ones.

2. Staking

Through staking the INVNT token to vote which pool higher INVNT inflation should go to and will be able to redeem the INVNT token with a discount.

3. Revenue sharing

Holders of the INVNT token will be receiving some part of the fee generated by the protocol.

TOKEN DISTRIBUTION

Tokens for the team will be distributed in different ways.

We base on milestones:

- Total value locked (TVL)
- Volume
- Token price

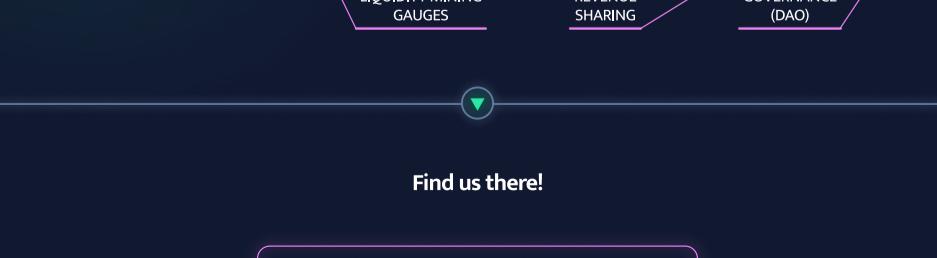

The team will receive a part of the tokens with each of the targets achieved. What matters for us is efficiency and results - not time.

We have an open source, well documented code.

Our dev's with pleasure and dedication will help other projects with integration with our application.
